Problem-Solving

ACADEMIC PROJECT

Vehicle Maintenance and Service Management System (VMSMS)

VMSMS is a web-based platform built with Django to streamline vehicle maintenance and service operations. It enables users, showrooms, staff, and admins to manage service bookings, service history, spare parts inventory, and financial transactions efficiently. The system automates notifications, maintenance scheduling, and reporting, improving operational efficiency and customer satisfaction.

Flood Prediction Using XGBoost

Developed a machine learning model using XGBoost to predict flood occurrences based on meteorological, hydrological, and environmental factors. Collected and preprocessed data from the Kaggle "Flood Prediction Dataset", performed feature engineering, and trained the model for high accuracy. The project aimed to enhance flood prediction reliability and support real-time decision-making.
